

WET SEASON LAWN CARE CALENDAR

November

It is the beginning of the wet season with rain and humidity returning this month.

Switch off your irrigation and let the rain do the heavy lifting.

December

Listen to your lawn. If the leaves have curled or wilted in the late afternoon, it's telling you it needs a drink.

Townsville soils typically get more than enough rain from December to March.

January

January is hot, humid and wet and is the peak of the mowing season.

Let your soil breathe and use a catcher on your mower to avoid grass clumps choking your yard.

February

February is typically the wettest month of the year. It is often very humid with rapid lawn growth.

Avoid water wastage by turning off automatic systems during rain.

March

Start training your lawn for the dry season with deep, infrequent watering for stronger roots.

Check and repair your irrigation for leaks and blockages.
