

What is a Smart Water Meter?

Water meters that work smarter, not harder

V200HT integrated smart water meter

What type of devices are being installed?

There are two types of installations that can occur:

- 1. Full replacement**
A honeywell V200HT integrated smart meter will be installed if a full replacement of a standard meter is required.
- 2. Clip on device (AMR)**
A clip on device will be attached to the existing standard meter. This clip on device can also be used for larger properties such as businesses and sporting fields.

Can I monitor my water usage?

Yes. You can access your water consumption data through the MiWater Portal on the Townsville City Council website.

You will first need to sign up and register an account. See the 'How to access the MiWater Portal' factsheet for further details on how to access MiWater.

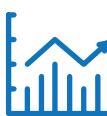

What is a Smart Water Meter?

A smart meter is either an integrated meter or a standard meter with a clip on tag that automatically records water consumption and electronically reports the data at hourly intervals to an online portal (MiWater).

Smart meters provide access to water consumption data that can highlight any issues or trends so you can better understand and manage your water consumption.

With an easy to read digital display and built-in transmitter, the smart meter sends hourly consumption reads to an online portal (MiWater). This information is stored in a secure database and only accessible to the property owner*.

Standard Metering

Dial display

7 year lifespan

Manual reading

Manual leak detection

Smart Metering

Digital display

15 year lifespan

Remote reading capabilities

Automatic leak detection

* Tenants can register in the portal with approval from the property owner, if they have registered.
